

Hyperparameter tuning

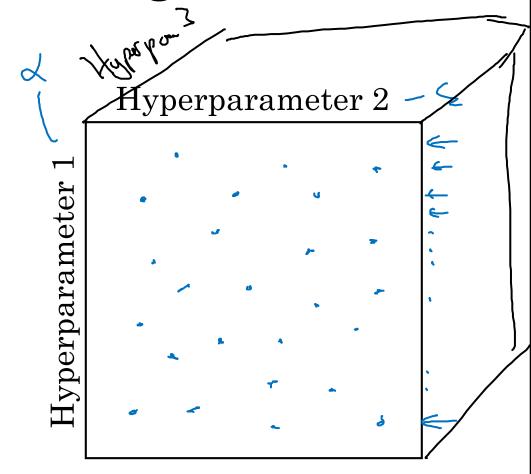

Tuning process

Hyperparameters

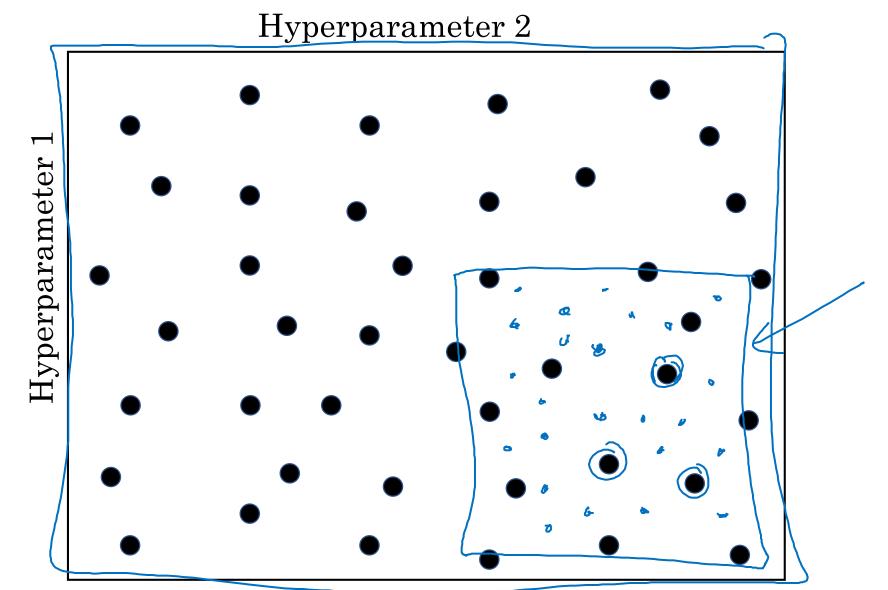

Try random values: Don't use a grid

Coarse to fine

Hyperparameter tuning

Using an appropriate scale to pick hyperparameters

Picking hyperparameters at random

Appropriate scale for hyperparameters

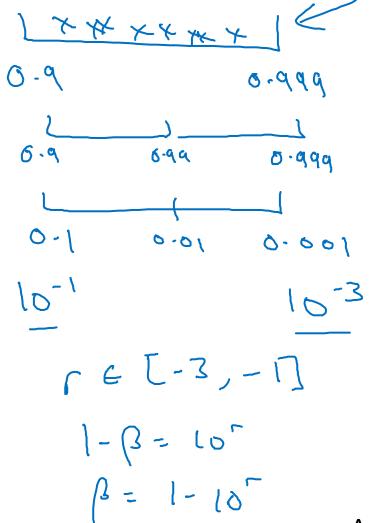

$$d = 0.0001 \dots$$

$$\frac{10^{-14}}{10^{-14}} \frac{10^{-14}}{10^{-14}} \frac{10^$$

Andrew Ng

Hyperparameters for exponentially weighted averages

$$\beta = 0.9 \dots 0.999$$

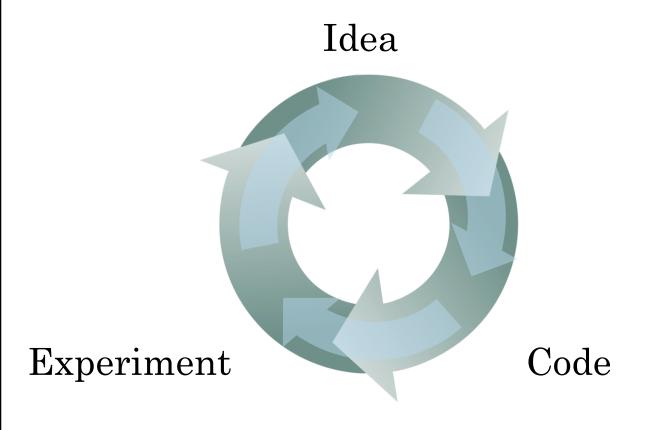

Hyperparameters tuning

Hyperparameters tuning in practice: Pandas vs. Caviar

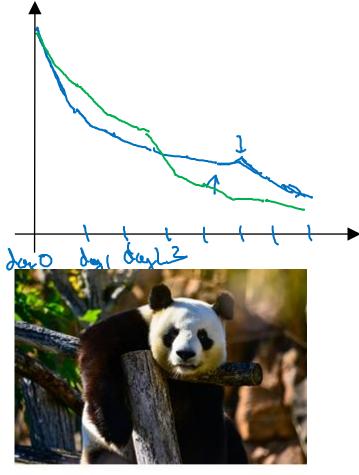

Re-test hyperparameters occasionally

- NLP, Vision, Speech, Ads, logistics,

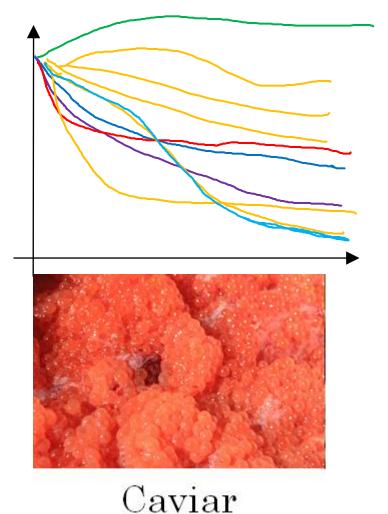

- Intuitions do get stale. Re-evaluate occasionally.

Babysitting one model

Panda

Training many models in parallel

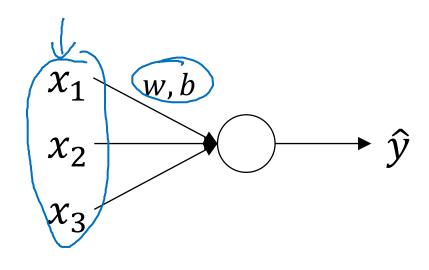

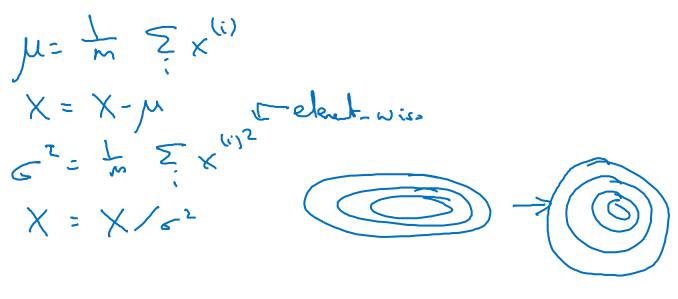

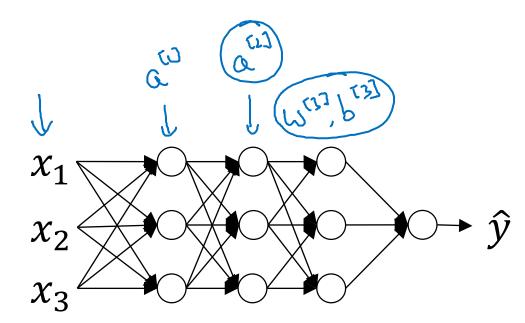

Batch Normalization

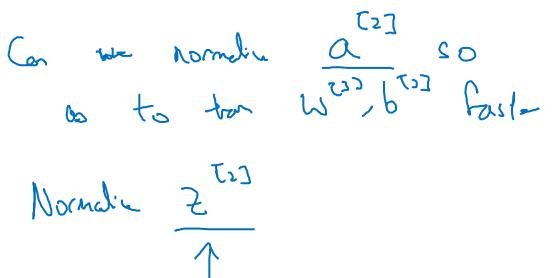

Normalizing activations in a network

Normalizing inputs to speed up learning

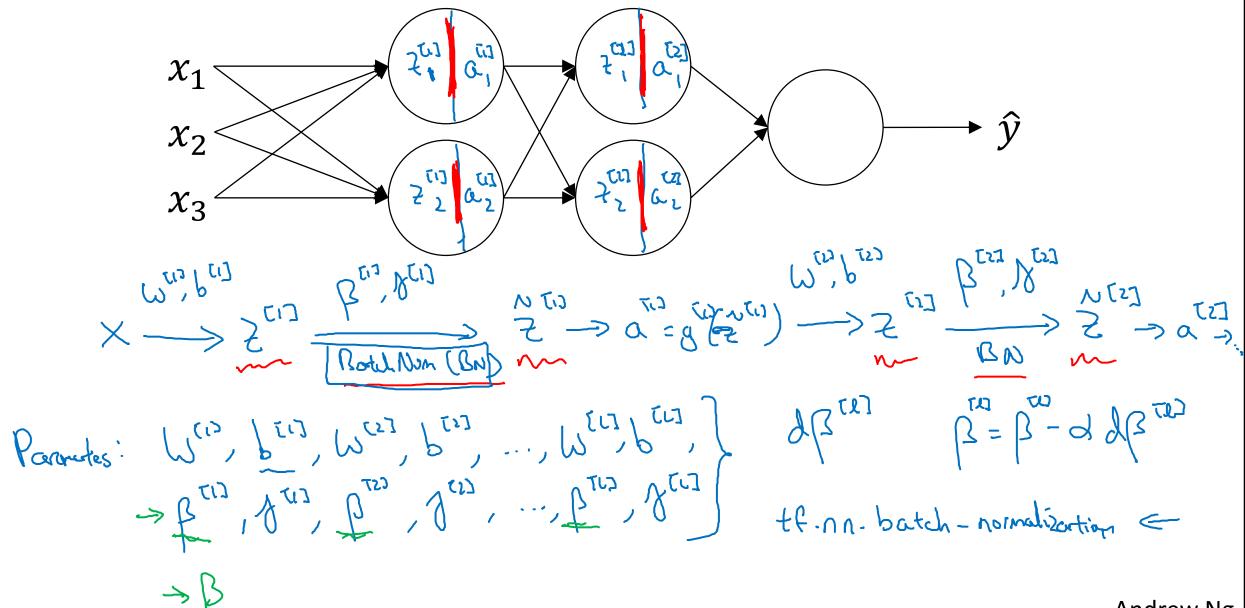

Implementing Batch Norm some intermediate values in NN µ= m ≥ 2(i)

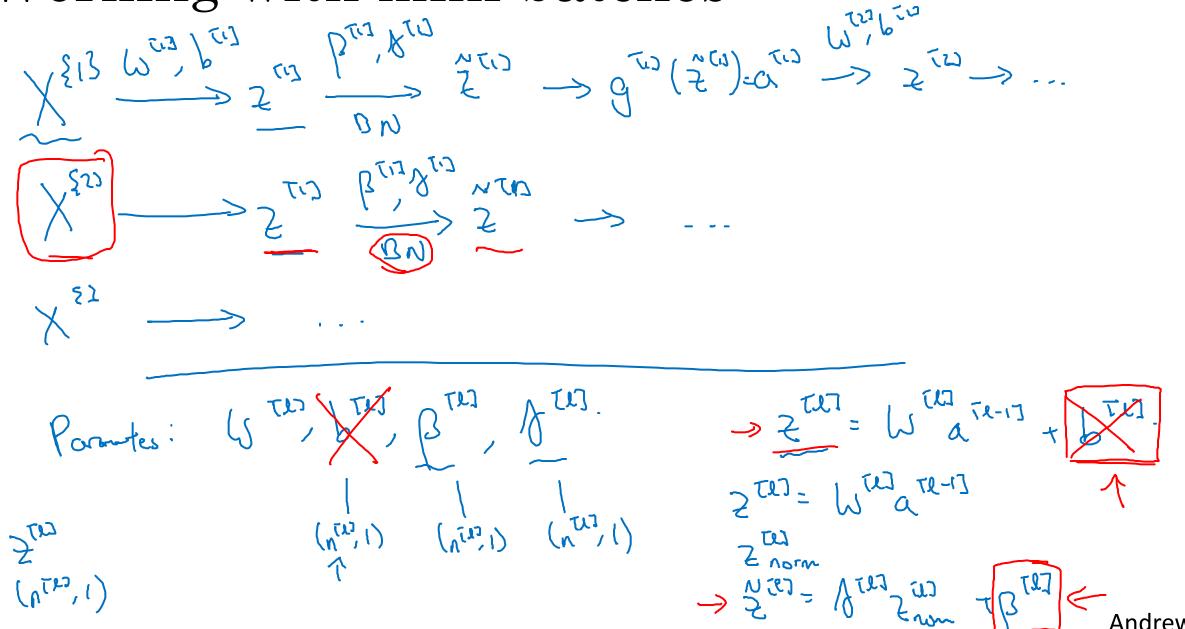

Batch Normalization

Fitting Batch Norm into a neural network

Adding Batch Norm to a network

Working with mini-batches

Implementing gradient descent

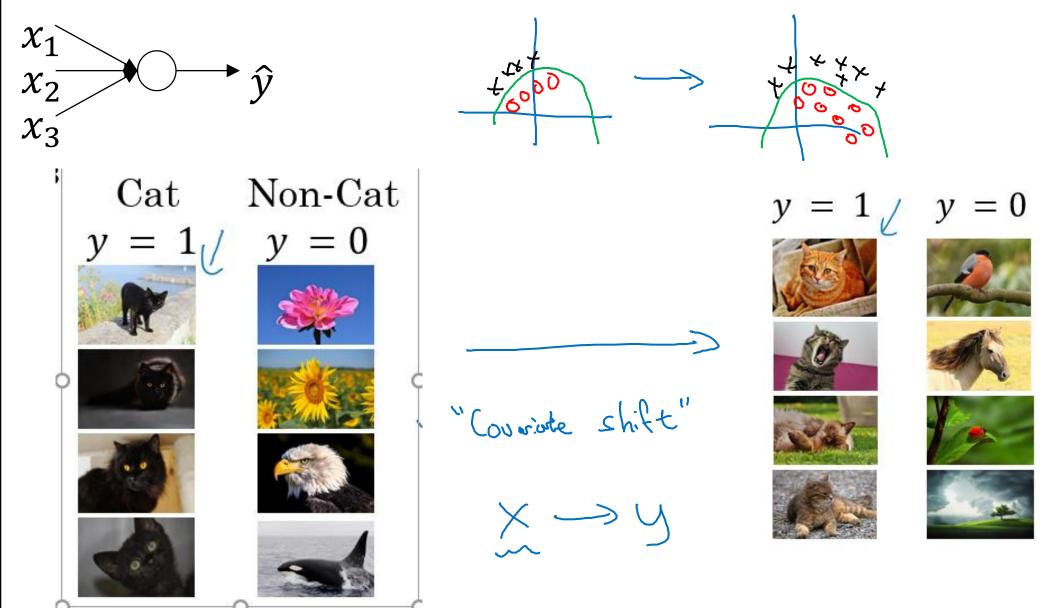

for t=1 num Mini Bortches Compute formal pap on X EtJ. It eat hidden lay, use BN to report 2 Tell with 2 Tell. Update pontes Win = Win adwing } = Bin adwing Bin adwing } = Bin adwing Works w/ momente, RMSpap, Adam.

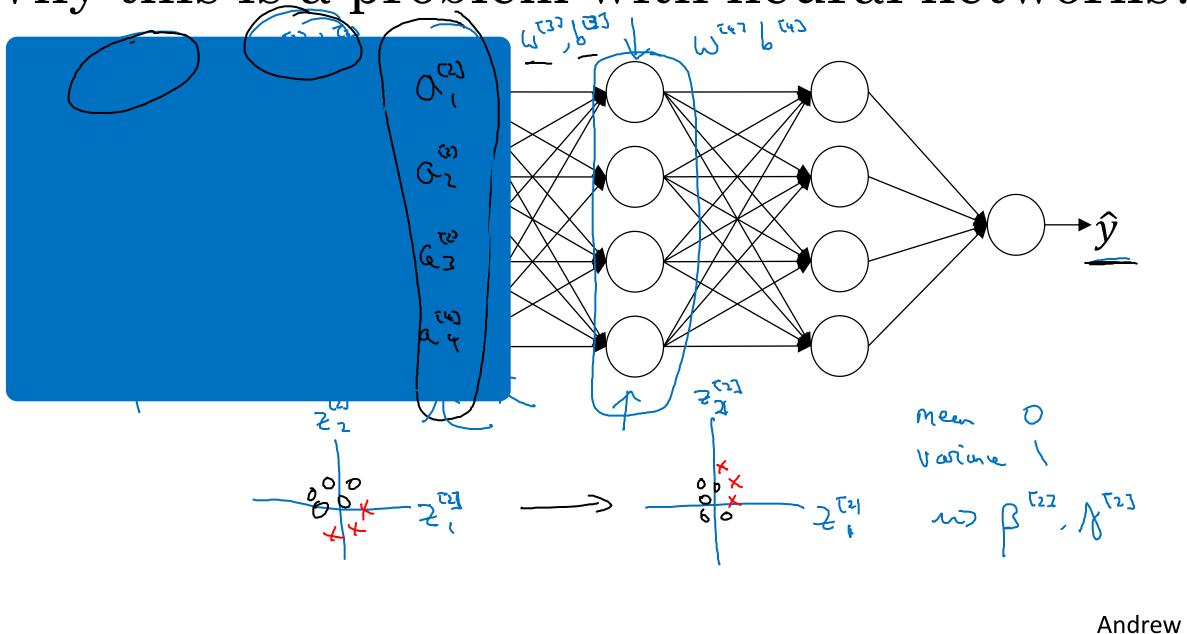

Batch Normalization

Why does Batch Norm work?

Learning on shifting input distribution

Why this is a problem with neural networks?

Batch Norm as regularization

- Each mini-batch is scaled by the mean/variance computed on just that mini-batch.
- This adds some noise to the values $z^{[l]}$ within that minibatch. So similar to dropout, it adds some noise to each hidden layer's activations.
- This has a slight regularization effect.

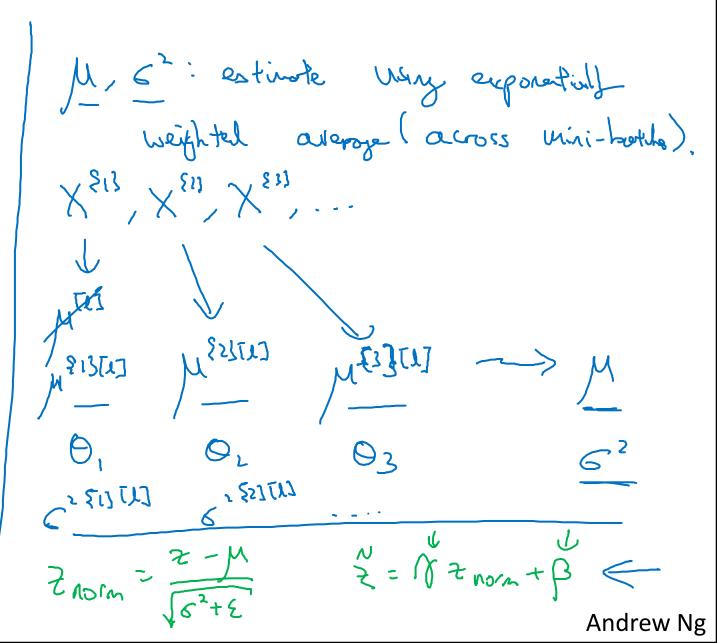

Batch Normalization

$$\mu = \frac{1}{m} \sum_{i} z^{(i)}$$

$$\sigma^{2} = \frac{1}{m} \sum_{i} (z^{(i)} - \mu)^{2}$$

$$Z_{\text{norm}}^{(i)} = \frac{z^{(i)} - \mu}{\sqrt{\sigma^{2} + \varepsilon}}$$

$$\tilde{z}^{(i)} = \gamma z_{\text{norm}}^{(i)} + \beta$$

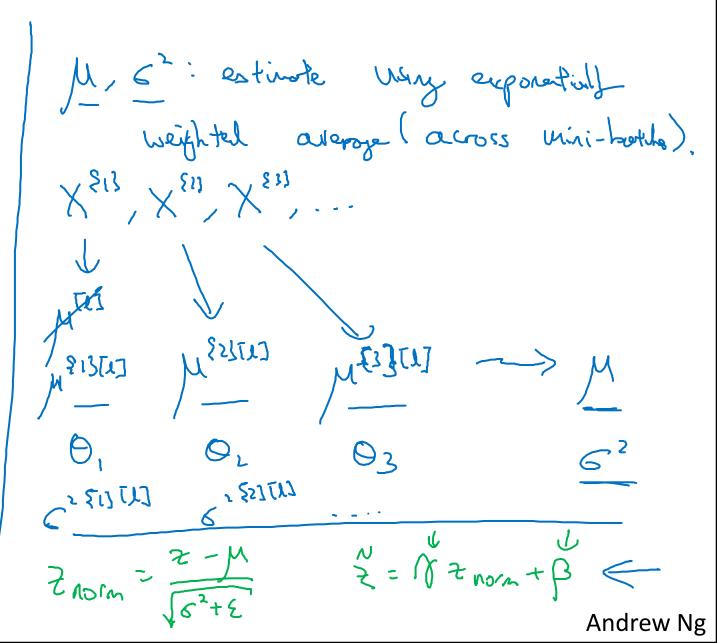

Batch Normalization

$$\mu = \frac{1}{m} \sum_{i} z^{(i)}$$

$$\sigma^{2} = \frac{1}{m} \sum_{i} (z^{(i)} - \mu)^{2}$$

$$Z_{\text{norm}}^{(i)} = \frac{z^{(i)} - \mu}{\sqrt{\sigma^{2} + \varepsilon}}$$

$$\tilde{z}^{(i)} = \gamma z_{\text{norm}}^{(i)} + \beta$$

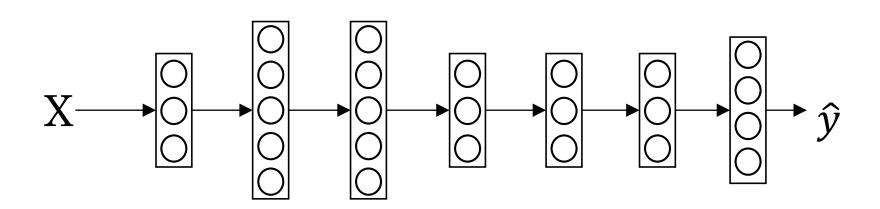

Multi-class classification

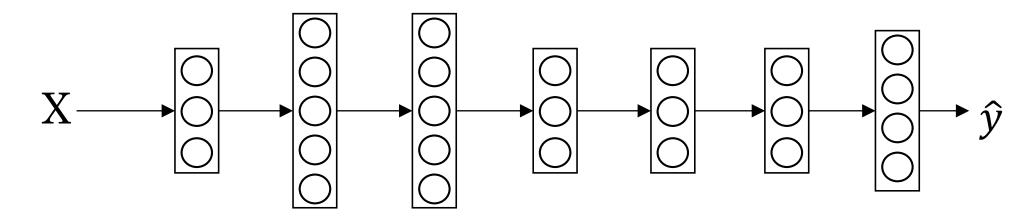

Softmax regression

Recognizing cats, dogs, and baby chicks

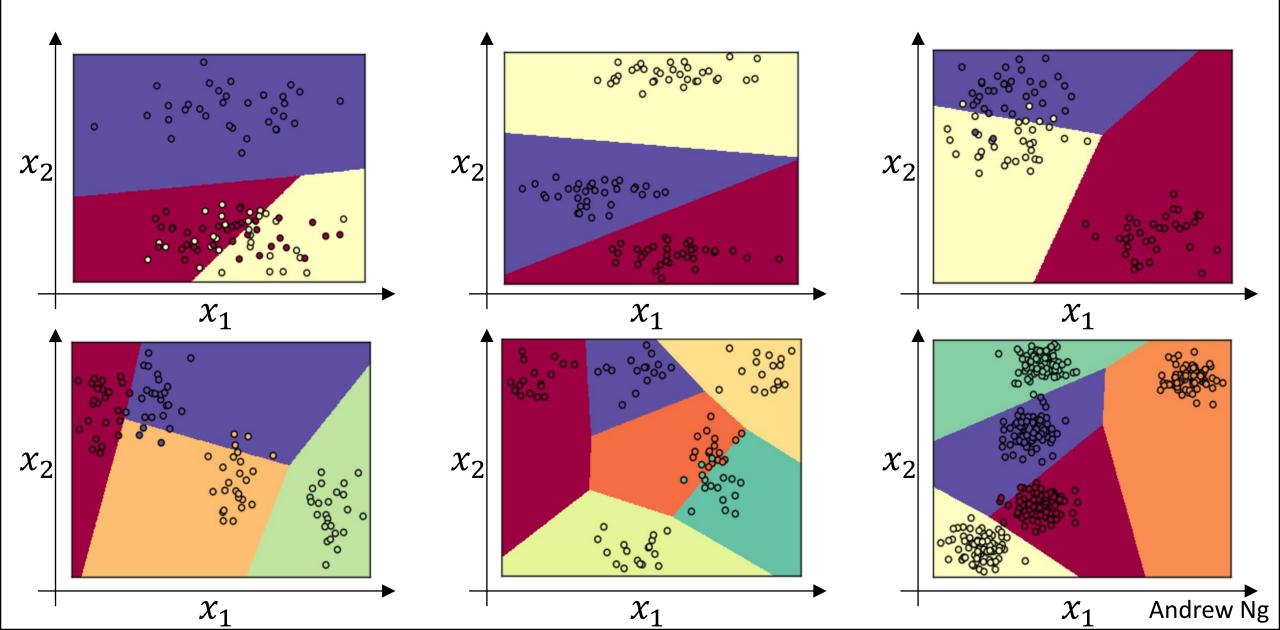

Softmax layer

Softmax examples

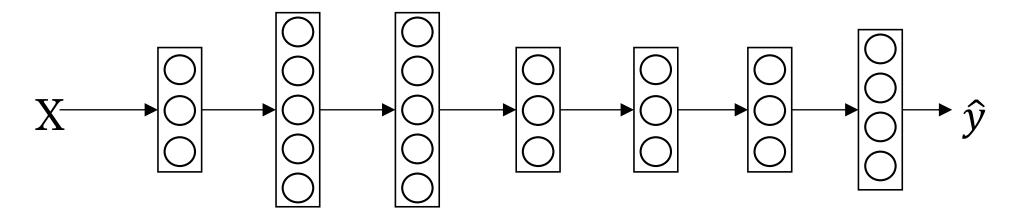

Multi-class classification

Trying a softmax classifier

Understanding softmax

Summary of softmax classifier

Programming Frameworks

Deep Learning frameworks

Deep learning frameworks

- Caffe/Caffe2
- CNTK
- DL4J
- Keras
- Lasagne
- mxnet
- PaddlePaddle
- TensorFlow
- Theano
- Torch

Choosing deep learning frameworks

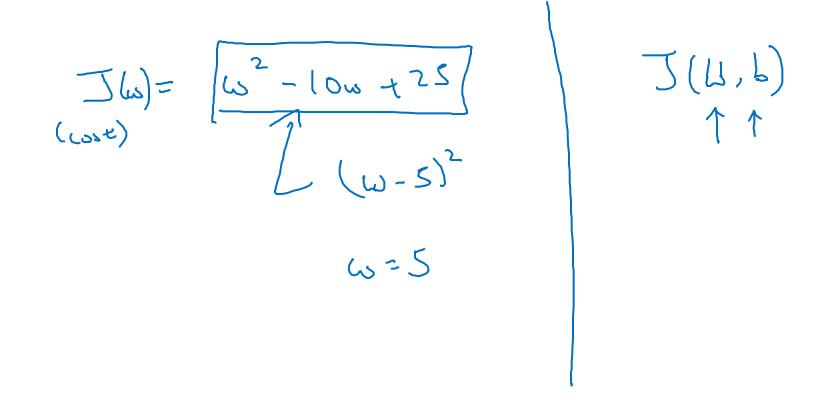

- Ease of programming (development and deployment)
- Running speed
- Truly open (open source with good governance)

Programming Frameworks

TensorFlow

Motivating problem

Code example

print(session.run(w))

```
import numpy as np
import tensorflow as tf
coefficients = np.array([[1], [-20], [25]])
w = tf.Variable([0],dtype=tf.float32)
x = tf.placeholder(tf.float32, [3,1])
cost = x[0][0]*w**2 + x[1][0]*w + x[2][0]
                                           # (w-5)**2
train = tf.train.GradientDescentOptimizer(0.01).minimize(cost)
init = tf.global_variables_initializer()
session = tf.Session()
session.run(init)
print(session.run(w))
for i in range(1000):
   session.run(train, feed_dict={x:coefficients})
```

```
with tf.Session() as session:
  session.run(init)
  print(session.run(w))
```
